## Abstracts

The global Space Pharmaceutical Services market size is predicted to grow from US\$ 839 million in 2025 to US\$ 1798 million in 2032; it is expected to grow at a CAGR of 11.7% from 2026 to 2032.

Space pharmaceutical services refer to an emerging high-tech technology that utilizes the special environmental conditions of space, such as microgravity, high vacuum, strong radiation, and high cleanliness, to carry out operations such as drug raw material processing, protein crystal growth, microbial strain mutation and improvement, and biomaterial purification through spacecraft platforms such as recoverable satellites and space stations, in order to obtain high-purity, high-efficiency drug products or high-performance strains that are difficult to produce in a terrestrial environment.

The prospects for space pharmaceutical services are promising, rapidly transitioning from a cutting-edge scientific experimental field to the early stages of industrialization with clear commercial value. Its development will be primarily driven by a positive cycle of 'successful technology validation - cost reduction - clear demand.' With the deepening commercial operation of the International Space Station, the opening of experimental opportunities on the Chinese Space Station, and the increasing maturity of commercial spacecraft and recoverable satellite services, the cost and barriers to entry into space will continue to decrease, while the frequency and reliability of experiments will significantly increase. In the short term, service demand will focus on providing top pharmaceutical and biotechnology companies with irreplaceable R&D tools to tackle challenging problems such as the structural analysis of specific high-value target proteins and the development of complex cell therapy products. In the medium to long term, once the technological and economic feasibility of producing certain extremely high-value biomaterials in orbit is verified, a completely new sub-industry of 'space

manufacturing' will emerge. Furthermore, in the context of deep space exploration, the need to develop in-orbit autonomously produced pharmaceuticals and regenerative medicine products for astronauts will also become an important technological driving force. Despite challenges such as high costs, regulatory gaps, and supply chain risks, space pharmaceuticals, as a cutting-edge field at the intersection of the bioeconomy and the space economy, is expected to achieve a key leap from 'serving scientific research' to 'creating disruptive products' within the next decade, becoming an indispensable strategic link in the innovative drug R&D system.
