The global Superconducting Microwave Quantum Computers market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Superconducting microwave quantum computers are a type of quantum computer that uses superconducting materials and microwave circuits to manipulate and store quantum information. Unlike classical computers that use binary digits or bits to represent information as either 0 or 1, quantum computers use quantum bits or qubits, which can represent both 0 and 1 simultaneously. This ability to exist in multiple states simultaneously is what makes quantum computers potentially much more powerful than classical computers for certain types of calculations.

In a superconducting microwave quantum computer, the qubits are typically made from superconducting materials, such as niobium or aluminum, and are manipulated using microwave circuits. These circuits are used to apply pulses of electromagnetic radiation to the qubits, which can change their state and perform operations on the quantum information stored in them.

United States market for Superconducting Microwave Quantum Computers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Superconducting Microwave Quantum Computers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
