A tactile vibration motor is a micro motor used to generate tactile feedback. It simulates physical touch through vibration and is widely used in consumer electronics, automobiles, medical and gaming equipment. It can generate vibrations of different frequencies, intensities and patterns according to the input signal, providing users with an immersive interactive experience, such as mobile phone notifications, game vibration feedback, smart watch reminders, etc. According to the technology type, tactile vibration motors can be divided into eccentric rotor motors (ERM) and linear resonance motors (LRA). Among them, LRA has gradually become the mainstream due to its fast response speed and low energy consumption.

United States market for Tactile Vibration Motor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
