Thick film conductor paste is a composite material formulated from conductive metal powders (e.g., silver, copper), glass frit as a binder, and an organic vehicle. It is printed onto substrates like ceramics or glass via screen printing and then fired to form adherent conductive patterns, electrodes, or interconnects. This paste is essential in manufacturing solar cells, hybrid circuits, and passive components.

In 2025, global production of thick-film conductor paste reached 1,847 tons, with an average selling price of US\$463/kg and a capacity of approximately 3,600 tons. The industry's gross profit margin was approximately 10%–20%. Cost structure: Direct materials accounted for approximately 90%, manufacturing costs for approximately 8%, and labor costs for approximately 2%. Industry chain: Upstream are suppliers of raw materials such as metal powders (e.g., silver powder), glass powder, and organic carriers; downstream are manufacturers of solar cells, printed circuit boards, and electronic components.
