## Abstracts

The global Thick Film Insulator Paste market size is predicted to grow from US\$ 95.87 million in 2025 to US\$ 134 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Thick film insulator paste is a composite functional material for electronic printing. It is formulated from inorganic functional powders (such as glass frit and ceramic fillers) and an organic vehicle (containing solvents, resins, etc.). The paste is deposited onto substrates or circuits via screen-printing and then fired at high temperatures to form a dense, adherent insulating film. This film primarily functions as an electrical insulator, a dielectric layer for crossover isolation in multilayer circuits, or the dielectric in thick film capacitors. It is essential for surface protection, component encapsulation, and ensuring the reliability of hybrid integrated circuits and various electronic components.

In 2025, the global production of thick-film insulator paste reached 524 tons, with an average selling price of US\$187/kg and a capacity of approximately 1,000 tons. The industry's gross profit margin was approximately 10%–20%. Cost structure: direct materials accounted for approximately 80%, manufacturing costs approximately 15%, and labor costs approximately 5%. Industry chain: upstream suppliers of raw materials such as metal powders, inorganic powders, and organic solvents; downstream manufacturers of electronic components such as solar cells, printed circuit boards, touch screens, and LEDs.
