The global Third Generation Semiconductor Power Devices market size is predicted to grow from US$ 6553 million in 2025 to US$ 25470 million in 2032; it is expected to grow at a CAGR of 21.8% from 2026 to 2032.

Third Generation Semiconductor Power Devices, also known as Wide Band Gap (WBG) Power Devices, represent a profound revolution in power electronics. Their definition is based on components fabricated from semiconductor materials?primarily Silicon Carbide (SiC) and Gallium Nitride (GaN)?whose band gaps are significantly wider than traditional Silicon (Si). These superior physical properties, such as higher breakdown electric fields, high thermal conductivity, and high electron saturation velocity, enable them to operate at higher voltages, higher frequencies, and higher temperatures while achieving far lower energy losses than silicon-based devices. The major product types are clearly divided into two camps: 1. Silicon Carbide (SiC) Devices, which include SiC MOSFETs and SiC SBDs (Schottky Barrier Diodes), serving as direct replacements for high-voltage Si-IGBTs. 2. Gallium Nitride (GaN) Devices, primarily GaN HEMTs (High Electron Mobility Transistors), which demonstrate disruptive advantages in low-to-mid voltage, high-frequency applications. Major application areas are similarly segmented: SiC, with its high-voltage tolerance, dominates New Energy Vehicles (especially 800V-architecture main inverters), Renewable Energy (PV inverters), and high-voltage industrial applications. GaN, leveraging its ultra-high switching frequency, has rapidly established itself in Consumer Electronics (compact fast chargers), Data Centers (high-efficiency server PSUs), and automotive Lidar systems.

The value chain for Third Generation Semiconductor Power Devices is highly concentrated at the front end. The Upstream?representing the core technological barrier and cost center?involves substrate manufacturing and epitaxial (Epi) growth. For SiC,

the fabrication of conductive SiC substrates (difficult and slow ingot growth) is the primary bottleneck, accounting for 30%-50% of the total device cost; this market is currently highly monopolized by a few companies like Wolfspeed (Cree), Coherent (II-VI), and Rohm (SiCrystal). The Midstream covers device design, fabrication, and packaging. This segment is dominated by IDMs (Integrated Device Manufacturers) because SiC/GaN fabrication processes (e.g., high-temperature ion implantation, MOCVD) are incompatible with standard silicon CMOS fabs and require dedicated lines. Representative IDMs include Infineon, STMicroelectronics, ON Semiconductor, Wolfspeed, and Rohm. The GaN sector also features a co-existing model of Fabless (e.g., Navitas, Innoscience) and Foundries (e.g., TSMC, X-Fab). The Downstream consists of system application integrators, including Automotive Tier-1 suppliers (e.g., Bosch, Vitesco), EV OEMs (e.g., Tesla, BYD), consumer electronics brands (e.g., Apple, Anker), server manufacturers (e.g., Dell, HPE), and PV inverter companies (e.g., SMA, SolarEdge).

Currently, the Third Generation Semiconductor Power Device industry is on the cusp of an explosive growth ramp-up. The current industry status is characterized by a 'SiC shortage and GaN acceleration.' On the SiC front, market demand?particularly from automotive main inverters?is far outpacing the capacity expansion of upstream substrates, leading to a persistent global shortage of SiC devices. To secure capacity, downstream customers (like Automotive Tier-1s) have widely entered into Long-Term Agreements (LTAs) with midstream IDMs. To alleviate cost pressures and scale production, major players are aggressively transitioning from 6-inch (150mm) to 8-inch (200mm) wafer fabrication, which is the current focal point of competition. On the GaN front, having achieved mass commercialization and cost validation in the consumer fast-charging market, it is now at a critical inflection point, penetrating higher-value segments such as data center PSUs and automotive OBCs/DC-DC converters. Capital Expenditure (CapEx) is at an all-time high, with major IDMs investing billions to construct new SiC fabs, while GaN players explore higher-integration solutions (e.g., GaN ICs).

Looking ahead, the future trends for the Third Generation Semiconductor Power Device industry will involve the parallel advancement of technology and cost reduction. 1. Scaling of 8-inch SiC Wafers: The transition to 200mm wafers is the primary pathway to reducing SiC device costs, enabling their adoption from premium EVs into mainstream models. 2. Integration of GaN: GaN will evolve from discrete components to 'GaN ICs'?integrating drivers, controllers, and protection circuits on-chip. This drastically simplifies system design and is key to its success in data centers and automotive sectors. 3. Advanced Module Packaging: Innovative packaging (e.g., double-sided

cooling, copper-clip bonding) is critical to fully leveraging the high-temperature and high-frequency performance of WBG devices. The industry's core driving factors are the ultimate global pursuits of 'Energy Efficiency' and 'Electrification': 1. Automotive Electrification (800V Architecture): This is the most powerful single driver. The 800V high-voltage platform enables faster charging and higher efficiency, and SiC is a rigid requirement to achieve this. 2. AI and Data Center Energy Consumption: The explosion in AI computing power has caused data center energy usage to surge. Adopting high-Fficiency GaN and SiC PSUs has become an imperative for reducing TCO and achieving carbon neutrality. 3. Renewable Energy Grid Integration: The demand for high-efficiency, high-power-density inverters in PV and energy storage systems provides a vast industrial market for SiC.

LP Information, Inc. (LPI) ' newest research report, the ?Third Generation Semiconductor Power Devices Industry Forecast? looks at past sales and reviews total world Third Generation Semiconductor Power Devices sales in 2025, providing a comprehensive analysis by region and market sector of projected Third Generation Semiconductor Power Devices sales for 2026 through 2032. With Third Generation Semiconductor Power Devices sales broken down by region, market sector and sub-sector, this report provides a detailed analysis in US$ millions of the world Third Generation Semiconductor Power Devices industry.

This Insight Report provides a comprehensive analysis of the global Third Generation Semiconductor Power Devices landscape and highlights key trends related to product segmentation, company formation, revenue, and market share, latest development, and M&A activity. This report also analyzes the strategies of leading global companies with a focus on Third Generation Semiconductor Power Devices portfolios and capabilities, market entry strategies, market positions, and geographic footprints, to better understand these firms? unique position in an accelerating global Third Generation Semiconductor Power Devices market.

This Insight Report evaluates the key market trends, drivers, and affecting factors shaping the global outlook for Third Generation Semiconductor Power Devices and breaks down the forecast by Type, by Application, geography, and market size to highlight emerging pockets of opportunity. With a transparent methodology based on hundreds of bottom-up qualitative and quantitative market inputs, this study forecast offers a highly nuanced view of the current state and future trajectory in the global Third Generation Semiconductor Power Devices.
