## Abstracts

The global Titanium Healing Abutment market size is predicted to grow from US\$ 259 million in 2025 to US\$ 332 million in 2032; it is expected to grow at a CAGR of 3.4% from 2026 to 2032.

In 2025, global Titanium Healing Abutment production reached approximately 17,700 k units with an average global market price of around US\$ 15 per unit, and a gross profit margin of approximately 10%-30%. A titanium healing abutment is a temporary transmucosal component used in dental implant therapy, designed to guide soft-tissue healing and protect the implant fixture before placement of the final abutment and prosthetic restoration. It is screwed onto the endosseous implant after implant placement or after a second-stage surgery, protruding through the gingiva to maintain access to the implant and shape the peri-implant soft tissue into a stable, cleansable emergence profile that will match the future crown, bridge, or overdenture. Most healing abutments are machined from medical-grade titanium alloys (e.g., Ti-6Al-4V ELI) because of their high strength, corrosion resistance, and excellent biocompatibility; titanium remains the dominant material even though zirconia and PEEK variations are increasingly used for esthetic or special indications. Upstream, titanium healing abutments depend on medical-grade titanium and titanium-alloy feedstock (rod, bar, or forgings), as well as increasing volumes of high-performance polymers such as PEEK and zirconia powders for alternative or hybrid healing caps. Midstream is dominated by dental implant and prosthetic manufacturers that design, machine, and validate healing abutments as part of their implant systems or compatible product families. These companies integrate digital workflows, offering encoded or scannable healing abutments, and operate under ISO 13485 quality systems with CE marking and FDA listings. Downstream, healing abutments are distributed through direct sales, specialized implant distributors, and online stores to dental clinics, dental service

organizations (DSOs), hospitals, and dental laboratories. They are used during single- or two-stage implant protocols to protect the implant and contour soft tissue, often integrated with digital impression systems via scan-friendly designs.
