The total carbon enrichment analyzer is an instrument used to determine the total carbon content in a sample. It is widely used in environmental monitoring, soil analysis, water quality testing, wastewater treatment and other fields to evaluate the carbon content in soil, sediment, sewage and other materials. The instrument usually converts the carbon in the sample into carbon dioxide by burning the sample or chemical oxidation, and then measures the amount of carbon dioxide produced by an infrared detector to calculate the total carbon content in the sample. This analysis is of great significance for evaluating carbon cycle, carbon storage, soil quality, etc.
