The global Uncompensated Pressure Sensor market size is predicted to grow from US$ 379 million in 2025 to US$ 467 million in 2031; it is expected to grow at a CAGR of 3.5% from 2025 to 2031.

An uncompensated pressure sensor is a fundamental pressure measurement device that directly translates pressure changes into an electrical signal without the benefit of built-in temperature compensation or calibration, resulting in a relatively low cost; this sensor relies on the deformation or capacitive change of its sensing element in response to pressure to produce an output signal proportional to the pressure, yet its output may be subject to inaccuracies due to environmental temperature variations, potentially leading to reduced measurement precision; lacking temperature compensation capabilities, the uncompensated pressure sensor may require additional corrective measures under conditions of significant temperature fluctuations to ensure the accuracy of readings, making it attractive in cost-sensitive applications where high precision is not a critical requirement.

United States market for Uncompensated Pressure Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Uncompensated Pressure Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
