The global White Glass IR Cut-Off Filters market size is predicted to grow from US\$ 168 million in 2025 to US\$ 211 million in 2032; it is expected to grow at a CAGR of 3.0% from 2026 to 2032.

In 2025, global White Glass IR Cut-Off Filters production reached approximately 2.1 billion units, with an average global market price of around US\$82 per thousand units. White Glass IR Cut-Off Filters are optical filter components made from clear or colorless optical glass substrates with multilayer coating films designed to block or sharply attenuate infrared light while allowing visible light to pass through. Unlike blue glass IR cut-off filters, which rely partly on the absorption properties of blue glass material, white glass IR cut-off filters mainly achieve infrared blocking through optical coating technology.

The White Glass IR Cut-Off Filters market is an important segment of the optical filter and imaging component industry, mainly driven by the growing demand for accurate color reproduction, high-definition imaging, compact camera modules, and advanced optical sensing systems. White glass IR cut-off filters are made from clear or colorless optical glass substrates and achieve infrared blocking mainly through multilayer optical coating rather than glass absorption, allowing visible light to pass while reflecting or attenuating near-infrared wavelengths. They are widely used in smartphone cameras, digital cameras, surveillance cameras, automotive cameras, machine vision systems, medical imaging devices, optical sensors, and scientific instruments, where infrared interference may cause color deviation, reduced contrast, image blur, or unstable white balance. Market demand is closely related to the expansion of consumer electronics, security monitoring, automotive ADAS, industrial automation, and medical imaging applications. Industry sources generally classify IR-cut filters by type, including white

glass IRCF, blue glass IRCF, and other filter types, and by application, including cell phone cameras, computer cameras, automotive cameras, and other imaging systems. White glass IR cut-off filters are also commonly associated with photography, imaging devices, optical instruments, and scientific equipment, and major participants mentioned in market reports include Hoya, Schott, Isuzu Glass, AGC, Optrontec, OFILM, Zhejiang Quartz Crystal Optoelectronic, Sumita Optical Glass, and Hermosa Optics. From the upstream perspective, the industry relies on high-quality optical glass substrates, dielectric coating materials, coating targets, polishing materials, precision cutting equipment, cleaning equipment, vacuum coating machines, optical testing instruments, and cleanroom production environments. The quality of upstream glass and coating materials directly affects visible-light transmittance, infrared cut-off accuracy, surface flatness, coating uniformity, durability, and production yield. The midstream mainly consists of optical filter manufacturers and camera component suppliers, which carry out glass slicing, grinding, polishing, multilayer coating, dicing, cleaning, inspection, packaging, and customized product development according to different customer requirements. Their competitiveness depends on coating design capability, spectral control precision, miniaturization technology, high-volume manufacturing capacity, cost control, and stable quality consistency. Downstream customers include camera module manufacturers, smartphone OEMs, security camera producers, automotive camera suppliers, medical device companies, machine vision integrators, and optical equipment manufacturers. In industrial applications, IR-cut filters are used to protect sensors from unwanted wavelengths and improve image quality, while machine vision, traffic monitoring, and surveillance are also important application areas. Looking forward, the White Glass IR Cut-Off Filters market is expected to develop toward thinner substrates, higher visible-light transmission, lower reflection, sharper infrared cut-off edges, better coating reliability, and stronger compatibility with compact optical modules. Growth will be supported by multi-camera smartphones, high-resolution image sensors, AI imaging, AR/VR devices, automotive driver-assistance cameras, smart surveillance, medical diagnostics, and industrial vision systems. At the same time, manufacturers will face challenges from price competition, strict quality requirements, coating process complexity, and the need to balance optical performance with mass-production yield. As optical systems become smaller, smarter, and more integrated, white glass IR cut-off filters will remain a key component for improving imaging accuracy and sensor performance, with future opportunities concentrated in high-end camera modules, automotive imaging, precision sensing, and customized optical solutions.
