The global Zinc Alloy Sacrificial Anode market size is predicted to grow from US$ 232 million in 2025 to US$ 309 million in 2031; it is expected to grow at a CAGR of 4.9% from 2025 to 2031.

A zinc alloy sacrificial anode is a metallic device designed to protect metal structures from corrosion through cathodic protection. It's made from a zinc alloy, which is more electrochemically active than the metal it protects, such as steel. When submerged in an electrolyte (like seawater), the zinc anode corrodes preferentially, 'sacrificing' itself to prevent the protected metal from corroding. These anodes are widely used in marine environments, pipelines, and underground structures to extend their lifespan by providing a continuous source of electrons that inhibit the corrosion process.

The zinc alloy sacrificial anode industry is tied to upstream zinc mining and alloying processes. Downstream, demand is driven by infrastructure projects, marine industries, and oil and gas sectors. Product specifications are trending towards higher purity alloys and optimized shapes for specific applications, enhancing efficiency and lifespan. The future market is expected to see steady growth, influenced by increasing infrastructure investments globally and stricter corrosion control regulations. The growth of offshore wind farms will also greatly increase demand. Environmental concerns are also pushing for improved recycling and more sustainable production methods.
