The technologies in emission control catalyst has undergone significant changes in recent years, with traditional two-way catalytic converters advanced three way catalytic converters. The rising wave of new technologies, such as exhaust gas recirculation (EGR) and selective catalytic reduction (SCR) are creating significant potential transportation and industrial applications, to reduce harmful emissions in the environment.

In the emission control catalyst market, various technologies, such as diesel particulate filter (DPF), gasoline particulate filter (GPF), diesel oxidation catalyst (DOC), selective catalytic reduction (SCR), and exhaust gas recirculation (EGR) technologies are used. Stringent emission regulations due to increased concern over environmental pollution and increase in the use of automotive diesel engines are creating new opportunities for various emission control catalyst technologies.

This report analyzes technology maturity, degree of disruption, competitive intensity, market potential, and other parameters of various technologies in the emission control catalyst market. Some insights are depicted below by a sample figure. For more details on figures, the companies researched, and other objectives/benefits on this research report, please download the report brochure.
