Abstracts

Hydrogels can be defined as water-swollen networks of polymers. Most are liquids at 4 degrees or room temperature but will form a gel when incubated at 37°C. Because of their properties, cells can be embedded inside hydrogels by mixing cell solution with hydrogel before gel formation: the mix is then dispensed in a cell culture vessel and during the gelation process cells will be encapsulated inside the gel. Compared to classical, 2D cell culture, cells cultured in 3D, embedded in gels, recover different characteristics they have when placed in their natural environment.

This report elaborates the market size, market characteristics, and market growth of the 3D Hydrogels For Cell Culture industry, and breaks down according to the type, application, and consumption area of 3D Hydrogels For Cell Culture. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for 3D Hydrogels For Cell Culture in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
