Abstracts

3D NAND Flash is a type of flash memory which involves stacking memory cells on top of each other to provide a higher capacity/volume ratio in a smaller physical space. It maximizes electrical efficiency by shortening the interconnect length between cells. Samsung’s 3D V-NAND was the first ever manufactured 3D NAND flash memory chip. The vertically stacked cell layers make use of charge trap flash (CTF) technology which enables it to offer memory of upto 128 GB on a chip. It has twice the write performance, twice the scalability and ten times the reliability of 2D, or planar NAND, which consequently improves the performance and stability of laptops, smart phones and tablets. 3D NAND chips are also used in Solid State Drives (SSDs) as they possess the characteristic of retaining data without power supply. The manufacturing process of 3D NAND is less complicated than that of alternative technologies, like RRAM, since it requires the same materials used to produce NAND, while FRAM, MRAM and RRAM and others require new materials that are not well explored and understood. Additionally, they are incorporated in a wide range of consumer electronic products and enterprise applications.
This report elaborates the market size, market characteristics, and market growth of the 3D NAND Flash Memory industry, and breaks down according to the type, application, and consumption area of 3D NAND Flash Memory. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for 3D NAND Flash Memory in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
