Abstracts

3D printing or additive manufacturing is a process of making three dimensional solid objects from a digital file. The creation of a 3D printed object is achieved using additive processes. In an additive process, an object is created by laying down successive layers of material until the object is created. 3D printing enables companies to produce complex (functional) shapes using less material than traditional manufacturing methods. For electronics manufacturers, 3D printing technology holds considerable potential, as speeding time to market can help the industry keep pace with ever-shortening product life cycles for electronics consumers, the ease with which the technology can be used to generate varied product designs holds great potential for creating customized forms and features.

This report elaborates the market size, market characteristics, and market growth of the 3D Printed Electronics industry, and breaks down according to the type, application, and consumption area of 3D Printed Electronics. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for 3D Printed Electronics in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
