Abstracts

A baggage handling system (BHS) is a type of conveyor system installed in airports that transports checked luggage from ticket counters to areas where the bags can be loaded onto airplanes. A BHS also transports checked baggage coming from airplanes to baggage claims or to an area where the bag can be loaded onto another airplane.

Although the primary function of a BHS is the transportation of bags, a typical BHS will serve other functions involved in making sure that a bag gets to the correct location in the airport. Sortation is the process of identifying a bag and the information associated with it, to decide where the bag should be directed within the system.

In addition to sortation, a BHS may also perform the following functions:

Detection of bag jams

Volume regulation (to ensure that input points are controlled to avoid overloading system)

Load balancing (to evenly distribute bag volume between conveyor sub-systems)

Bag counting

Bag tracking

Redirection of bags via pusher or diverter
