Abstracts

Amorphous metal cores is a non-crystal substance created by rapidly freezing liquids of high temperature. Because there is no rule of atomic arrangement, the energy loss (hysteresis loss) is small when the flux of magnetic induction passes through the iron core. In addition, eddy current loss is decreased because the thickness is approximately 0.03 mm, which is about 1/10 compared with silicon steel. Therefore, the no load loss (eddy current loss and hysteresis loss) can be decreased to about 1/5 of silicon steel's. This report elaborates the market size, market characteristics, and market growth of the Amorphous Metal Cores industry, and breaks down according to the type, application, and consumption area of Amorphous Metal Cores. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Amorphous Metal Cores in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
