Abstracts

Ampicillin, a semi-synthetic derivative of penicillin, causes cell death by interfering directly with bacterial cell wall synthesis and indirectly by initiating the release of enzymes that further aids in altering the cell wall. Presence of an amino group is the only difference between ampicillin and penicillin. An amino group in ampicillin aids penetration through the outer membrane of gram-positive and certain gram-negative bacteria. Ampicillin finds use as an antibiotic in preventing and treating a number of bacterial infections such as respiratory tract infections, meningitis, salmonella infections, urinary tract infections, and endocarditis. Ampicillin is also used in the treatment of group B streptococcal infection in newborns. Ampicillin was the first 'broad spectrum' type of penicillin having activity against gram-positive bacteria.

This report elaborates the market size, market characteristics, and market growth of the Ampicillin industry, and breaks down according to the type, application, and consumption area of Ampicillin. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Ampicillin in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
