## **Abstracts**

Animal model is a living, non-human animal used during the research and investigation of human disease, for the purpose of better understanding the disease without the added risk of harming an actual human being during the process. Animal models serving in research may have an existing, inbred or induced disease or injury that is similar to a human condition. The animal chosen usually meets a determined taxonomic equivalency to humans, so as to react to disease or its treatment in a way that resembles human physiology as needed. The use of animal models allows researchers to investigate disease states in ways which would be inaccessible in a human patient, performing procedures on the non-human animal that imply a level of harm that would not be considered ethical to inflict on a human.

This report elaborates the market size, market characteristics, and market growth of the Animal Model Services industry, and breaks down according to the type, application, and consumption area of Animal Model Services. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
