Abstracts

The term "application container," which has several meanings in IT, has come to be used for a new type of technology that helps provide consistency and efficient design in the context of hardware virtualization. In virtualization, an application container is a controlling element for an application instance that runs within a type of virtualization scheme called container-based virtualization. In traditional hypervisor-based virtualization, isolated processes and machines run on their own individual operating systems, independently attached to a controlling hypervisor. The virtualization system allocates memory and processing power as needed.

This report elaborates the market size, market characteristics, and market growth of the Application Container Service industry, and breaks down according to the type, application, and consumption area of Application Container Service. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Application Container Service in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
