Abstracts

Aseptic packaging technology is fundamentally different from that of conventional Food processing by canning. In canning, the process begins with treating the Food prior to filling. Initial operations inactivate enzymes so that these will not degrade the product during processing. The package is cleaned, and the product is introduced into the package, usually hot. Generally, air that can cause oxidative damage is removed from the interior. The package is hermetically sealed and then subjected to heating. The package must be able to withstand heat up to about 100°C for high acid products and up to 127°C for low acid products, which must receive added heat to destroy heat-resistant microbial spores. Packages containing low-acid (above pH 4.5) Food must withstand pressure as well.

This report elaborates the market size, market characteristics, and market growth of the Aseptic Packaging in the Food industry, and breaks down according to the type, application, and consumption area of Aseptic Packaging in the Food. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
