Abstracts

The combustion of coal in coal-fired boilers produces unburned residues. These residues include bottom ash, also known as clinker ash, which exists at the bottom of the boiler. Bottom ash generally accounts for less than the quarter of the total ash production. This ash must be collected and disposed of owing to adverse environmental and health concerns. Despite its use in cement and other building material manufacturing, large quantities must still be disposed of in landfills, waste sites or impoundments. Intermittent removal of bottom ash collected at the bottom of the furnace is carried out using bottom ash handling systems.

This report elaborates the market size, market characteristics, and market growth of the Ash Handling System industry, and breaks down according to the type, application, and consumption area of Ash Handling System. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
