Abstracts

Aluminum Extrusion is a plastic deformation process in which a solid cylinder of aluminum (billet) is forced by compression through a smaller die opening. The billet is typically preheated to facilitate the deformation process. Aluminium extrusions can play key roles in integrated engineering solutions for automotive structures and component parts. One of the main advantages is to reduce the weight of the car.

This report elaborates the market size, market characteristics, and market growth of the Automotive Aluminium Extrusions industry, and breaks down according to the type, application, and consumption area of Automotive Aluminium Extrusions. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
