Abstracts

A wheel cylinder is a component of a hydraulic drum brake. The wheel cylinder must force apart the brake shoes and press them against the brake drum. This generates friction and the wheel is decelerated. This happens every time the driver presses on the brake pedal. Pressing on the brake pedal generates a hydraulic pressure in the master brake cylinder which is transmitted to the wheel cylinder in the brake fluid via the brake lines. In the wheel cylinder, the hydraulic pressure acts on the pistons, which then exert mechanical pressure on the brake shoes.

This report elaborates the market size, market characteristics, and market growth of the Automotive Brake Wheel Cylinders industry, and breaks down according to the type, application, and consumption area of Automotive Brake Wheel Cylinders. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
