Abstracts

The torsion bar is basically a length of metal rod anchored at one end to the car body and at the other end to the suspension lower link. As the wheel passes over a bump the bar twists. It returns to its original position when the bump is passed and restores the car to its normal drive height. The resistance of the bar to twisting has the same effect as the spring used in more conventional suspension systems. A certain amount of load is permanently applied to the bar to maintain the car's ride height.

This report elaborates the market size, market characteristics, and market growth of the Automotive Torsion Bar industry, and breaks down according to the type, application, and consumption area of Automotive Torsion Bar. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
