Abstracts

A software-defined radio is a wireless communication device in which the transmitter and receiver functions are changed or changed using software without any changes to the hardware. These radios eliminate the need to use capacitors and resistors because software-based algorithms are used to select specific necessary frequencies. An autonomous software-defined radio receiver is an software-defined radio receiver that can be configured autonomously for any type of signal arriving at the antenna. This report elaborates the market size, market characteristics, and market growth of the Autonomous Software-Defined Radio Receiver industry, and breaks down according to the type, application, and consumption area of Autonomous Software-Defined Radio Receiver. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Autonomous Software-Defined Radio Receiver in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
