Abstracts

Beta thalassemia is a group of hemoglobinopathies in which the synthesis of the beta chain is partially or completely inhibited. The child is asymptomatic at birth, more than the onset of infancy, 50% of the patients within 3 to 6 months after birth, occasionally the neonatal period. The earlier the onset age, the heavier the condition. Severe chronic progressive anemia requires blood transfusion to maintain life, and blood transfusions are given once every 3 to 4 weeks, with increasing age.

This report elaborates the market size, market characteristics, and market growth of the Beta Thalassemia Testing industry, and breaks down according to the type, application, and consumption area of Beta Thalassemia Testing. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
