Abstracts

Bio Polymers are polymers produced by living organisms. Because they are polymers, biopolymers contain monomeric units that are covalently bonded to each other to form a larger structure. There are three main types of major biopolymers depending on the monomers used and the biopolymers formed: polynucleotides are long polymers composed of 13 or more nucleotide monomers, and the polypeptide is an amino acid. a short polymer, and the polysaccharide is usually a structure in which the sugar is linearly linked.

This report elaborates the market size, market characteristics, and market growth of the Bio Polymers industry, and breaks down according to the type, application, and consumption area of Bio Polymers. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Bio Polymers in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
