Abstracts

Blind rivets are named so because they can be installed without access to the back side of the item being riveted. They are composed of the rivet and an integrated mandrel.

Blind rivets are installed in a tight hole that passes through the materials being riveted (Step 1 & 2). A riveter is used to pull the mandrel back while holding the rivet in place (Step 3). As the mandrel is pulled back it deforms the rivet pushing the sides outward until the mandrel snaps (Step 4). This expanded size forms the back side of the rivet holding the materials together.

Blind rivets allow objects to be fastened together when access is only possible from one side. Blind rivets are commonly used with electronics, structural steel beams, and aircraft.

This report elaborates the market size, market characteristics, and market growth of the Blind Rivet industry, and breaks down according to the type, application, and consumption area of Blind Rivet. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Blind Rivet in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
