## Abstracts

Bridge Rectifier converts the alternating current generated by the alternator into direct current, so as to supply power to the electrical equipment and charge the battery, and restrict the battery current from flowing back to the generator to protect the generator from being burned by the reverse current. The bridge rectifier circuit overcomes the disadvantages of the full-wave rectifier circuit that requires the center tap of the transformer secondary and the diode to withstand the back pressure, but additionally uses two diodes. With the rapid development of semiconductor devices and the low cost, this disadvantage is not prominent, and thus bridge rectifier circuits are widely used in practice.

This report elaborates the market size, market characteristics, and market growth of the Bridge Rectifier industry, and breaks down according to the type, application, and consumption area of Bridge Rectifier. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Bridge Rectifier in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
