Abstracts

Brightness Enhancement Film (BEF) is widely used in the design and manufacture of LCD screens and large-screen TVs. It is generally used to provide maximum brightness towards the on-axis viewer.

BEF uses a microreplicated prismatic structure to control the exit angle of the light. Light within the viewing cone (approximately 35° off the perpendicular) is transmitted out and light outside this angle is TIRed back into the film and recycled until it is within this cone angle.

This report elaborates the market size, market characteristics, and market growth of the Brightness Enhancement Film industry, and breaks down according to the type, application, and consumption area of Brightness Enhancement Film. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Brightness Enhancement Film in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
