Abstracts

Cadmium electroplating is widely used to protect steel and cast iron from corrosion. The cadmium plating is used to protect the inner metal. Since cadmium is the anode relative to iron, the underlying iron metal can be protected by the consumption of the cadmium plate even when the cadmium is pulled or cracked. Cadmium is usually applied as a thin layer (less than 25 μ m or 1 mil thick) for atmospheric corrosion resistance.

This report elaborates the market size, market characteristics, and market growth of the Cadmium Electroplating industry, and breaks down according to the type, application, and consumption area of Cadmium Electroplating. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Cadmium Electroplating in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
