Abstracts

Calcium formate is calcium salt of formic acid. It is typically odorless. Calcium formate exists as a white, free-flowing, crystalline solid. It is also known as formic acid calcium salt, calcium diformate, or calcoform. The molecular formula of calcium formate is $C_2H_2CaO_4$. The salt can be produced synthetically from high-temperature and high-pressure reaction between calcium hydroxide and carbon monoxide. Calcium formate is also available industrially as a byproduct, from the preparation of pentaerythritol and other polyhedric alcohols and of disodium dithionite. It is a handy source of calcium and formate ions for aqueous solutions. Calcium formate is non-hygroscopic and it has low toxicity. The salt may cause irritation to skin and eyes. It can also cause gastrointestinal irritation with nausea, vomiting, and diarrhea.

This report elaborates the market size, market characteristics, and market growth of the Calcium Formate industry, and breaks down according to the type, application, and consumption area of Calcium Formate. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Calcium Formate in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
