Abstracts

Childhood absence epilepsy (CAE), also known as pyknolepsy, is an idiopathic generalized epilepsy which occurs in otherwise normal children. The age of onset is between 4–10 years with peak age between 5–7 years. Children have absence seizures which although brief (~4–20 seconds), they occur frequently, sometimes in the hundreds per day. The absence seizures of CAE involve abrupt and severe impairment of consciousness. Mild automatisms are frequent, but major motor involvement early in the course excludes this diagnosis. The EEG demonstrates characteristic 'typical 3Hz spike-wave' discharges.

This report elaborates the market size, market characteristics, and market growth of the Childhood Absence Epilepsy Therapeutics industry, and breaks down according to the type, application, and consumption area of Childhood Absence Epilepsy Therapeutics. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
