Abstracts

Ion-exchange membranes in chlor-alkali process (also called ion exchange membranes in chlor-alkali membrane cell process) are the synthetic membranes employed to produce chlorine (Cl₂) and alkali, sodium hydroxide (NaOH) or potassium hydroxide (KOH) by electrolysis of a salt solution. These membranes are permeable to either positively or negatively charged ions in aqueous solution used in the chlor-alkali industry. The membranes that are selectively permeable to positively charged ions are usually named cation-exchange membranes (CEM), and membranes selectively permeable for negatively charged ions are called anion membranes (AEM). The selectivity occurs due to high concentration of immobile (fixed) ions within the membrane body.

This report elaborates the market size, market characteristics, and market growth of the Chlor-Alkali Ion Exchange Membrane industry, and breaks down according to the type, application, and consumption area of Chlor-Alkali Ion Exchange Membrane. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Chlor-Alkali Ion Exchange Membrane in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
