## **Abstracts**

A Class D amplifier or switching amplifier is an electronic amplifier in which the amplifying device (transistor, usually MOSFET) is used as an electronic switch, not as a linear gain device like other amplifiers. They are rapidly switching back and forth between power rails, and the modulators use pulse width, pulse density, or related technologies to encode the audio input into a burst, which is then powered by them. Audio enters the speakers through a simple low-pass filter. High-frequency pulses up to 6 MHz may be blocked. Since the pair of output transistors are never turned on at the same time, there is no path other than a low-pass filter / speaker to allow current to flow. Therefore, the efficiency can exceed 90%.

This report elaborates the market size, market characteristics, and market growth of the Class D Audio Amplifier industry, and breaks down according to the type, application, and consumption area of Class D Audio Amplifier. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
