## **Abstracts**

Blades and vanes in aircraft turbine engines are responsible for extracting energy from the high pressure and high temperature gas generated in combustion chamber. As such, they are designed and manufactured to withstand high pressure and temperature for long durations. To last in this tough environment, turbine blades often use different methods of cooling, such as thermal barrier coatings, internal air channels, and boundary layer cooling. Blade fatigue is a major source of failure in turbines. Fatigue is caused by the stress induced by vibration and resonance within the operating range of machines.

This report elaborates the market size, market characteristics, and market growth of the Commercial Aircraft Turbine Blades and Vanes industry, and breaks down according to the type, application, and consumption area of Commercial Aircraft Turbine Blades and Vanes. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Commercial Aircraft Turbine Blades and Vanes in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
