Abstracts

Parachutes are devices used to reduce aerodynamic motion of an object by creating drag to drop payloads including people, equipment, bombs, and relief aids from airborne platforms. Historically, parachutes were made using lightweight silk materials; however, most modern parachutes are made using nylon or synthetic polymers. Parachutes are broadly classified into two categories such as ascending and descending canopies, where former ones are designed to provide ascend movements or lift to the flying paragliders, whereas the descending canopies are used for airdropping any object or people from airborne platforms.

This report elaborates the market size, market characteristics, and market growth of the Commercial and Military Parachute industry, and breaks down according to the type, application, and consumption area of Commercial and Military Parachute. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
