Abstracts

Compressor valves are circular and include a series of rings or plates put between the valve cover and seat. With every pressure difference, the rings or plates are pulled toward the greater pressure area and therefore use springs to come back to their initial position when pressure returns to normal range. The rings or plates are pulled toward the high pressure area and use springs to get back to their position when pressure normalizes. Compressor valves are used to allow gas flow to and from the cylinder area within any compressor. These valves operate when a pressure difference occurs. This report elaborates the market size, market characteristics, and market growth of the Compressor Valves industry, and breaks down according to the type, application, and consumption area of Compressor Valves. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Compressor Valves in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
