Abstracts

The crankshaft associated with the crank is a mechanical component that is capable of switching between reciprocating motion and rotational motion. In a reciprocating engine, it converts the reciprocating motion of the piston into a rotary motion; in a reciprocating compressor, it converts the rotational motion into a reciprocating motion. To switch between the two movements, the crankshaft has a 'crank rotation' or 'crank pin' with the axis of the additional bearing surface offset from the bearing surface of the crank and the 'big end' of the connecting rod from each cylinder connected to the surface.
This report elaborates the market size, market characteristics, and market growth of the Crankshafts industry, and breaks down according to the type, application, and consumption area of Crankshafts. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Crankshafts in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
