Abstracts

CRISPR (Clustered Regularly Interspaced Short Palindromic Repeat) is an RNA guided gene editing system that uses bacterially derived protein (Cas9) and a synthetic guided RNA to introduce a double strand break at a particular location within the genome. Through this method, bacteria capture short sequences of nucleic acid from invading pathogens and combine them in CRISPR loci amidst the repeats. Small RNA's produced by transcription of CRISPR loci, guides a set of bacterial endonucleases to split the genomes of invading pathogens. This system has been adopted as a powerful technique enabling genome editing into the mainstream.

This report elaborates the market size, market characteristics, and market growth of the CRISPR industry, and breaks down according to the type, application, and consumption area of CRISPR. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
