Abstracts

Desktop virtualization is a technology based on server virtualization. It stores the operating system software, application software and user data required by all desktop PCs into the back-end server and is given to specific users through a special management system. The user connects to the desktop resource allocated by the back-end server through a dedicated network transmission protocol. After the connection, the user can directly use the desktop system running in the background on the connection local terminal, and the usage experience is basically the same as the physical PC.
This report elaborates the market size, market characteristics, and market growth of the Desktop Virtualization in Manufacturing industry, and breaks down according to the type, application, and consumption area of Desktop Virtualization in Manufacturing. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
