Abstracts

Diatomaceous Earth, also known as D.E., diatomite, or kieselgur/kieselguhr, is a naturally occurring, soft, siliceous sedimentary rock that is easily crumbled into a fine white to off-white powder. It has a particle size ranging from less than 3 micrometres to more than 1 millimetre, but typically 10 to 200 micrometres. The properties which make Diatomaceous Earth valuable include low density, high porosity, high surface area, abrasiveness, insulating properties, inertness, absorptive capacity, brightness, and high silica content. It is mainly used as filter aids, fillers, absorbents etc.

This report elaborates the market size, market characteristics, and market growth of the Diatomaceous Earth industry, and breaks down according to the type, application, and consumption area of Diatomaceous Earth. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Diatomaceous Earth in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
