Abstracts

Dry etching refers to the removal of material, typically a masked pattern of semiconductor material, by exposing the material to a bombardment of ions (usually a plasma of reactive gases such as fluorocarbons, oxygen, chlorine, boron trichloride; sometimes with addition of nitrogen, argon, helium and other gases) that dislodge portions of the material from the exposed surface.

This report elaborates the market size, market characteristics, and market growth of the Dry Etching System industry, and breaks down according to the type, application, and consumption area of Dry Etching System. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
