Abstracts

Volt-VAR Control or VVC refers to the process of managing voltage levels and reactive power (VAR) throughout the power distribution systems. These two quantities are related, because as reactive power flows over an inductive line (and all lines have some inductance) that line sees a voltage drop. VVC encompasses devices that purposely inject reactive power into the grid to alter the size of that voltage drop, in addition to equipment that more directly controls voltage.

This report elaborates the market size, market characteristics, and market growth of the Dynamic Volt VAR Control Architecture industry, and breaks down according to the type, application, and consumption area of Dynamic Volt VAR Control Architecture. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Dynamic Volt VAR Control Architecture in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
