Abstracts

E-passports are mainly used to authenticate the identity of a traveler during international travels. This technology stores data about the traveler on a smart chip, which bears a unique identification number and a digital signature. Its use is more secure than traditional paper technology, as it reduces the risk of data duplication and alteration. The data stored electronically on the chip is authenticated by public key infrastructure (PKI), which helps eliminate forgeries. Fingerprint, facial, and iris recognition are the major biometric modalities used in this technology. Increase in thefts, illegal immigration, and transborder crimes fuels e-passport market.

This report elaborates the market size, market characteristics, and market growth of the E-Passport industry, and breaks down according to the type, application, and consumption area of E-Passport. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for E-Passport in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.
