Abstracts

Electric Motors is a device that converts electrical energy into mechanical energy. It uses a coiled coil to generate a rotating magnetic field and acts on the rotor to form a magnetoelectric rotational torque. Generators is a mechanical device that converts other forms of energy into electrical energy. It is driven by a turbine, steam turbine, diesel engine or other power machinery to convert the energy generated by water flow, gas flow, fuel combustion or nuclear fission into mechanical energy that is transmitted to the generator, which is then converted into electrical energy by the generator.

This report elaborates the market size, market characteristics, and market growth of the Electric Motors and Generators industry, and breaks down according to the type, application, and consumption area of Electric Motors and Generators. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
