Abstracts

Electronic sphygmomanometer is a device used to measure blood pressure, composed of an inflatable cuff to collapse and then release the artery under the cuff in a controlled manner, and a mercury or mechanical manometer to measure the pressure. It is always used in conjunction with a means to determine at what pressure blood flow is just starting, and at what pressure it is unimpeded. Manual sphygmomanometers are used in conjunction with a stethoscope.

This report elaborates the market size, market characteristics, and market growth of the Electronic Sphygmomanometer industry, and breaks down according to the type, application, and consumption area of Electronic Sphygmomanometer. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
