Abstracts

The empennage is a device that is mounted at the rear of the aircraft to enhance flight stability. Most tails include horizontal and vertical tails, and a few use V-tails. The empennage can be used to control the pitch, yaw and tilt of the aircraft to change its flight attitude. The rear wing is an important part of the flight control system.

The rear wing, professionally known as spoiler, is part of the automotive aerodynamic package. The main function of the rear wing of the car is to reduce the lift of the tail of the vehicle. If the lift of the tail is larger than the lift of the front, it will easily lead to excessive steering of the vehicle, reduced grip of the rear wheel and poor high-speed stability.

This report elaborates the market size, market characteristics, and market growth of the Empennages industry, and breaks down according to the type, application, and consumption area of Empennages. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.

In Chapter 3.4 of the report, the impact of the COVID-19 outbreak on the industry was fully assessed. Fully risk assessment and industry recommendations were made for Empennages in a special period. This chapter also compares the markets of Pre COVID-19 and Post COVID-19.

In addition, chapters 8-12 consider the impact of COVID-19 on the regional economy.
