Abstracts

FIM or File Integrity Monitoring is an internal control process with the ability to verify company application software files and operating system integrity. The file integrity monitoring system checks the integrity of these sectors by using an authentication method, which then identifies the current file state and compares it to a known good baseline. There are several advantages to using a file integrity monitoring system, such as the ability of the system to track human error, identify the source of the attack, and manage and control the data.

This report elaborates the market size, market characteristics, and market growth of the File Integrity Monitoring industry, and breaks down according to the type, application, and consumption area of File Integrity Monitoring. The report also conducted a PESTEL analysis of the industry to study the main influencing factors and entry barriers of the industry.
